

**WHAT IS CLAIMED IS:**

1. A method for handling content request and delivery, comprising the steps of:  
receiving at least one request for content sent upstream from at least one user  
5 over a first network;  
sending the request for content upstream to a content library over a second  
network;  
receiving content retrieved from the content library, based on the request, and  
sent downstream from the content library over a third network, wherein the third  
10 network is distinct from the second network; and  
processing the retrieved content for delivery downstream to the user.
2. The method of claim 1, wherein the step of processing comprises buffering the  
retrieved content.  
15
3. The method of claim 2, wherein the buffering of the retrieved content reduces  
variations in a rate of delivery of the retrieved content to the user.
4. The method of claim 1, further comprising sending the retrieved content  
20 downstream to the user over the first network.
5. The method of claim 4, wherein the downstream bandwidth of the first network  
is greater than the upstream bandwidth of the first network.
- 25 6. The method of claim 1, wherein the first network includes an RF network.

7. The method of claim 1, wherein the third network has high bandwidth for delivering content downstream from the content library compared to the bandwidth of the second network for sending requests upstream to the content library.

5 8. The method of claim 1, wherein the second network and the third network are distinct logical networks.

9. The method of claim 8, wherein the second network and the third network are distinct physical networks.

10

10. The method of claim 1, wherein after an initial request for content is sent to the content library, the step of sending a request for content is repeated for subsequent requests.

15 11. The method of claim 10, wherein if content is lost before being delivered downstream to the user, a request for the lost content is sent upstream to the content library along with a subsequent request for content.

12. The method of claim 10, wherein the step of sending a request for content is  
20 performed while content retrieved based on previously sent requests is received and processed.

13. The method of claim 1, wherein the requested content includes at least one of video data, audio data and binary large object data.

25

14. The method of claim 1, wherein the user is associated with a content-on-demand subscriber.

15. The method of claim 1, wherein the retrieved content received from the content library is in an encrypted form, and the step of processing includes decrypting the encrypted retrieved content.
- 5 16. The method of claim 1, wherein the step of sending the request for content includes sending authentication information to gain access to the content in the content library.
- 10 17. The method of claim 1, wherein the content library is associated with a content library server that performs file system processing on the content retrieved from the content library.
- 15 18. The method of claim 1, wherein the content retrieved from the content library is received as raw data, and the step of processing includes performing file system processing on the retrieved content.
19. The method of claim 1, wherein the step of processing includes transforming the retrieved content into a format suitable for delivery to the user.
- 20 20. An apparatus for handling content request and delivery, comprising:  
means for receiving at least one request for content sent upstream from at least one user over a first network;  
means for sending the request upstream to a content library over a second network;  
25 means for receiving content retrieved from the content library based on the request and sent downstream from the content library over a third network, wherein the third network is distinct from the second network; and  
processing means for processing the retrieved content for delivery to the user.

21. The apparatus of claim 20, wherein the processing means includes means for buffering the retrieved content.

5 22. The apparatus of claim 21, wherein the buffering means reduces variations in a rate of delivery of the retrieved content to the user.

23. The apparatus of claim 20, further comprising means for sending the retrieved content downstream to the user over the first network.

10

24. The apparatus of claim 23, wherein the downstream bandwidth of the first network is greater than the upstream bandwidth of the first network.

25. The apparatus of claim 20, wherein the first network includes an RF network.

15

26. The apparatus of claim 20, wherein the third network has high bandwidth for delivering content downstream from the content library compared to the bandwidth of the second network for sending requests upstream to the content library.

20 27. The apparatus of claim 20, wherein the second network and the third network are distinct logical networks.

28. The apparatus of claim 27, wherein the second network and the third network are distinct physical networks.

25

29. The apparatus of claim 20, wherein after an initial request for content it sent to the content library, the sending means sends subsequent requests.

30. The apparatus of claim 29, wherein if content is lost before being delivered downstream to the user, a request for the lost content is sent upstream to the content library along with a subsequent request for content.
- 5 31. The apparatus of claim 29, wherein the sending means sends requests for content while the content retrieved based on previously sent request is received by the receiving means and processed by the processing means.
32. The apparatus of claim 20, wherein the requested content includes at least one  
10 of video data, audio data, and binary large object data.
33. The apparatus of claim 20, wherein the user is associated with a content-on-demand subscriber.
- 15 34. The apparatus of claim 20, wherein the retrieved content received from the content library is in an encrypted form, and the processing means includes means for decrypting the encrypted retrieved content.
- 20 35. The apparatus of claim 20, wherein the means for sending the request for content sends authentication information to gain access to the content in the content library.
36. The apparatus of claim 20, wherein the content library is associated with a content library server that performs file system processing on the content retrieved from  
25 the content library.

37. The apparatus of claim 20, wherein the content retrieved from the content library is received as raw data, and the step of processing includes performing file system processing on the retrieved content.

5 38. The apparatus of claim 20, wherein the processing means transforms the retrieved content into a format suitable for delivery to the user.

39. A system for handling content request and delivery, comprising:  
a first network over which at least one request for content is received upstream  
10 from at least one user;  
at least one server for receiving the request for content sent upstream from the user over the first network;  
a second network over which the request is sent upstream from the server;  
a content library for receiving the request sent upstream from the server,  
15 wherein content is retrieved from the content library based on the request; and  
a third network for delivering the retrieved content from the content library downstream to the server, wherein the server processes the retrieved content for delivery downstream to the user.

20 40. The system of claim 39, wherein the server buffers the retrieved content.

41. The system of claim 40, wherein the buffering reduces variations in a rate of delivery of the retrieved content.

25 42. The system of claim 39, wherein the server sends the retrieved content downstream to the user over the first network.

43. The system of claim 42, wherein the downstream bandwidth of the first network is greater than the upstream bandwidth of the first network.

44. The system of claim 39, wherein the first network includes an RF network.

5

45. The system of claim 39, wherein the third network has high bandwidth for delivering content downstream from the content library compared to the bandwidth of the second network for sending requests upstream to the content library.

10 46. The system of claim 39, wherein the second network and the third network are distinct logical networks.

47. The system of claim 46, wherein the second network and the third network are distinct physical networks.

15

48. The system of claim 39, wherein after an initial request for content is sent to the content library, the server continues sending subsequent requests for content.

49. The system of claim 48, wherein if content is lost before being delivered  
20 downstream to the user, a request for the lost content is sent upstream to the content library along with a subsequent request for content.

50. The system of claim 48, wherein the server continues requesting content from the content library while content is being retrieved based on previously sent requests,  
25 delivered to the server, and processed by the server.

51. The system of claim 39, wherein the requested content includes at least one of video data, audio data, and binary large object data.

52. The system of claim 39, wherein the user associated with a content-on-demand subscriber.

5 53. The system of claim 39, wherein the content is received at the server in an encrypted form, and the processing performed by the server includes decrypting the retrieved content.

54. The system of claim 39, wherein the server sends authentication information  
10 with the request for content to the content library to gain access to the content in the content library.

55. The system of claim 39, wherein the content library is associated with a content library server that performs file system processing on the content retrieved from the  
15 content library.

56. The system of claim 39, wherein the content retrieved from the content library and sent to the server is raw data, and the server performs file system processing on the retrieved content.

20

57. The system of claim 39, wherein the server transforms the retrieved content into a format suitable for delivery to the user.

25
